

HOW COLLABORATION CONTRIBUTES TO PERSONAL SUCCESS

The Test

In the NASA moon landing project, students are asked to rank 15 items in terms of survivability importance.

Students begin by working solo, and then transition into working with a group. They then compare their scores with NASA, with lower skills demonstrating better proficiency.

Overall Results

Given a sample size of a class of 23 students, approximately 86% of students saw an improvement in their score after working with a group.

The average personal score rested at approximately 41, and the average group score rested at approximately 27, resulting in an improvement of 1.5x.
